Resident Data Portals

- HL7, XML or delimited files
- Secure VPN or Secure FTP.
- Bi-Directional Integration
- Health Information Exchange

When implementing an Electronic Medical Record (EMR) it is essential that you have a central location for all Assessments, Evaluations, Orders, Notes, Documentation and Results. You want to be able to see the entire record of a resident's care. This is a unique challenge for Long Term Care facilities because many of the care providers are not employed within the facilities. Physician, pharmacy, lab, radiology and rehab services are frequently provided by contracted companies. The data they collect on each resident is part of the EMR and must be stored appropriately.

Each of these providers will have their own systems where they record this information. We contractually guarantee that we will perform all programming required of us to integrate cueSHIFT with your contracted care provider systems, using industry accepted protocols. Soon there will be national Interoperability Standards that will regulate the protocols that must be used to share data between all systems used in healthcare. We endorse these standards and are using them in our integration efforts with providers in the region.
